Experiment No 4

Information Gathering Using theHarvester

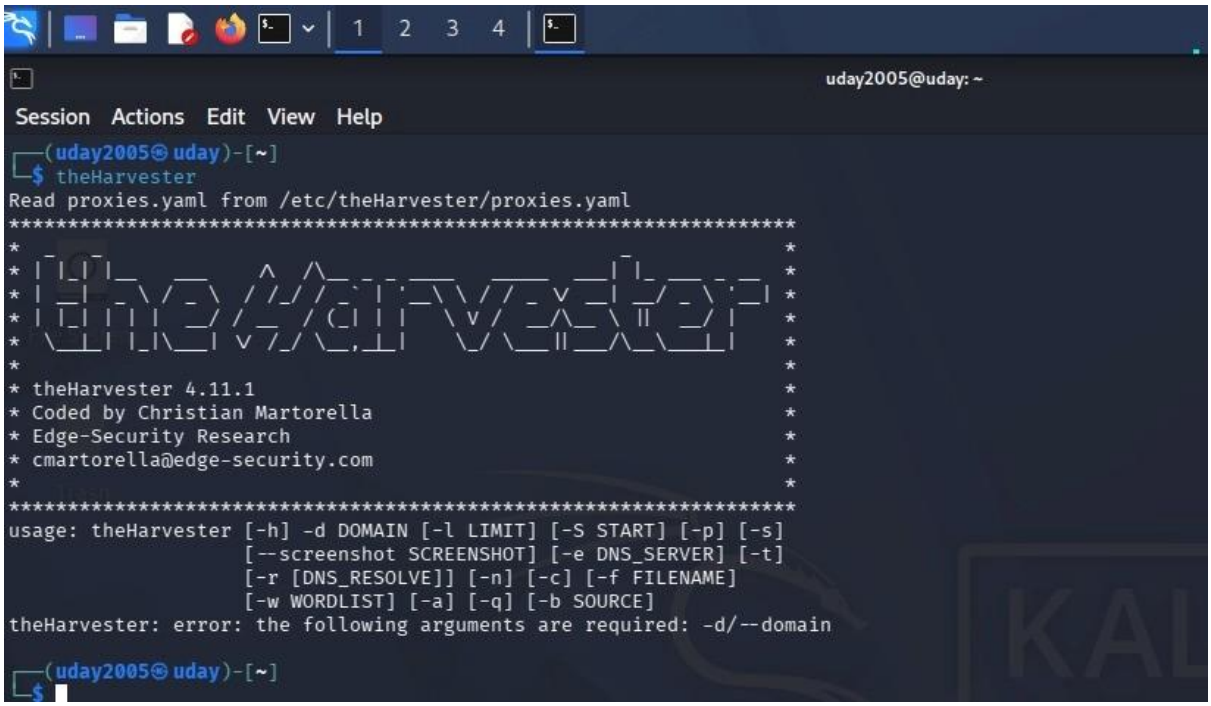

Aim

To gather publicly available information about a target domain using theHarvester tool in Kali Linux.

Algorithm

1. Start Kali Linux and open the Terminal.
2. Check whether theHarvester is installed.
3. Install theHarvester if it is not available.
4. Execute the command theHarvester -d example.com -b duckduckgo.
5. Collect publicly available information, such as email addresses, subdomains, and hostnames.
6. Observe and analyze the output.

Output

Result

Thus, information gathering using theHarvester was performed successfully to identify publicly available information about the authorized target domain.
